Base stations are distributed over a wide range of areas (covering urban, mountainous, rural, coastal, and desert environments). Some sites are located in remote locations and face harsh ...

As we stand at this technological crossroads, one truth emerges: The most effective communication base station maintenance guide isn't a static document, but a living system ...

In this article, a robust RL-based multicells sleeping model called graph deep deterministic policy gradient (GDDPG) is developed for handling highly complex communication scenarios. ...

Maintaining and upgrading communication base stations is essential for reliable and efficient wireless network operation. Regular maintenance includes inspection, cleaning, software ...

The GBS delivers the same output power as conventional base stations but in a more compact and lightweight form factor, reducing infrastructure costs, eliminating the need ...

We apply this framework to evaluate the energy performance of homogeneous and hybrid energy storage systems supplied by harvested solar energy. We present the complete ...

As network traffic increases, power consumption increases proportionally to the number of base stations. However, reducing the number of base stations may degrade network quality.

We review the architecture of the BS and the power consumption model, and then summarize the trends in green cellular network research over the past decade.

In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable

communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for ...

China Mobile conducted research and pilot validation of multi-energy complementary solutions and "source-grid-load-storage" integration for communication site ...
